Silhuette coefficient[1]

For each object x_i define:

- s_i-mean distance to objects in the same cluster
- d_i-mean distance to objects in the next nearest cluster

Silhouette coefficient for x_i:

$$Silhouette_i = \frac{d_i - s_i}{\max\{d_i, s_i\}}$$

Silhouette coefficient for $x_1, ... x_N$:

$$Silhouette = \frac{1}{N} \sum_{i=1}^{N} \frac{d_i - s_i}{\max\{d_i, s_i\}}$$

---

[1]Peter J. Rousseeuw (1987). "Silhouettes: a Graphical Aid to the Interpretation and Validation of Cluster Analysis". Computational and Applied Mathematics 20: 53–65.

Discussion

- Advantages
  - The score is bounded between -1 for incorrect clustering and +1 for highly dense clustering.
  - Scores around zero indicate overlapping clusters.
  - The score is higher when clusters are dense and well separated.
- Disadvantages
  - complexity $O(N^2 D)$
    - use feature space indexing or random subsampling
  - The Silhouette Coefficient is generally higher for convex clusters than other concepts of clusters
    - such as density based clusters.

Calinski-Harabaz Index[2]

- Consider K clusters. For cluster $k = 1, 2, ... K$ define
  - n_k - number of objects, c_k - centroid, C_k - indexes of objects
- Within cluster covariance matrix

$$W = \frac{1}{N - K} \sum_{k=1}^{K} \sum_{x \in C_k} (x - c_k)(x - c_k)^T$$

- Between cluster covaraince matrix

$$B = \frac{1}{K - 1} \sum_{k=1}^{K} n_k (c_k - c)(c_k - c)^T$$

- Calinski-Harabaz Index:

$$I = \frac{\text{tr } B}{\text{tr } W}$$

[2]Caliński, T., & Harabasz, J. (1974). "A dendrite method for cluster analysis". Communications in Statistics-theory and Methods 3: 1-27.

Discussion

- Advantages
  - The score is higher when clusters are dense and well separated.
  - Complexity $O(ND)$
- Drawbacks
  - Index favours convex clusters

Example

Calinski-Harabaz Index will be small here.
